

On moduli spaces and stringy corrections

with Jim Liu (work in progress)

From quantum gravity point of view, probing string theory at fundamental level
⇒ study of stringy corrections:

- ★ α' expansion ⇒ higher derivative corrections to the supergravity
- ★ the genus expansion ⇒ string quantum corrections in spacetime

Why more? again? now?!

- things to be learned for 4D $\mathcal{N} = 1$ physics
- test (develop) Generalised complex geometry?
 - ▷ natural appearance of generalised connections, some kinematic structures
 - ▷ the truly **non-linear** tests ahead

$\mathcal{N} = 2$ D=4 physics Type II strings on CY threefolds at the happy intersection of:

- ★ 2D SCFT
- ★ special geometry
- ★ algebraic geometry

Kähler potential:

$$\diamond \quad K = -2 \log \left(\mathcal{V}_3 - \frac{\zeta(3)}{32\pi^3 \cdot g_s^{3/2}} \chi(X_3) \right)$$

- ▷ \mathcal{V}_3 and $\chi(X_3)$ - classical volume of CY and Euler number of $X_3 \Rightarrow$ 10D origin
- ▷ $\zeta(3)$ - stringy!

... traces back to higher derivative ($\sim \alpha'^3$) R^4 corrections in 10D

- 10D 4pt (linearized) computations are largely sufficient
- NOT enough for $\mathcal{N} = 1$ results (higher-point functions, other fields)

$\mathcal{N} = 2$: mostly under control

$\mathcal{N} = 1$: hard, but ... optimistic

$$\hat{\Gamma} = \sqrt{\text{td}} \exp(i\Lambda)$$

The additive log Gamma class:

$$\Lambda = \text{Im} \log \Gamma(1 + \frac{x}{2\pi i}) = \Lambda_2 + \Lambda_6 + \dots$$

with

$$\Lambda_2 = \frac{\gamma}{2\pi} c_1(X), \quad \Lambda_6 = -\frac{\zeta(3)}{(2\pi)^3} 2\text{ch}_3(X), \dots$$

The perturbative Kähler potential

$$e^{-K} \sim \int_X e^{\sum t_l H_l} \hat{\Gamma} / \bar{\hat{\Gamma}} + \dots$$

t_l - (imaginary part of) Kähler moduli space coordinates; $H_l \in H^{1,1}(B_3)$

... (!?) non-trivial string-theoretic cancellations **must** hold in $\mathcal{N} = 4$ (minimal 6D susy)

R^4 corrections in string theory (and GCG)

- ★ Type II theories

- tree-level: $e^{-2\phi}(t_8 t_8 + \frac{1}{4}\epsilon_8 \epsilon_8) R^4$
- one loop: $(t_8 t_8 \mp \frac{1}{4}\epsilon_8 \epsilon_8) R^4$ (IIA/IIB)
 $X_8(R) \sim (t_8 \epsilon_8 + \epsilon_8 t_8) R^4 \sim [\frac{1}{4}p_1^2(TX) - p_2(TX)]$ (coupling $B \wedge X_8(R)$)

- ★ t_8 tensor (.... which we can see in GCG!)

- $t_8 t_8 R^4 = t_{\mu_1 \dots \mu_8} t_{\nu_1 \dots \nu_8} R^{\mu_1 \mu_2}_{\nu_1 \nu_2} \dots R^{\mu_7 \mu_8}_{\nu_7 \nu_8}$ ($t_8 M^4 = 24 (\text{tr } M^4 - \frac{1}{4}(\text{tr } M^2)^2)$)
- $\gamma_{\mu_1 \mu_2} \dots \gamma_{\mu_7 \mu_8} \longrightarrow t_{\mu_1 \dots \mu_8} + \gamma_{\mu_1 \dots \mu_8}$
- All 6d (0,2) multiplet anomalies $\sim X_8(R)$... (too easy?)

- ★ At linearised level : $\Omega^{\text{LC}} \longrightarrow \Omega_{\pm}$

- * $R(\Omega_{\pm})_{\mu\nu}^{\alpha\beta} = R_{\mu\nu}^{\alpha\beta} \pm \nabla_{[\mu} H_{\nu]}^{\alpha\beta} + \frac{1}{2} H_{[\mu}^{\alpha\gamma} H_{\nu]\gamma}^{\beta}$ ($R(\Omega_+)_{{\mu\nu}\alpha\beta} = R(\Omega_-)_{\alpha\beta\mu\nu}$)

- ★ At non-linear level : $R(\Omega^{\text{LC}}) \longrightarrow R(\Omega_{\pm})$ (✓ GCG!) ... but not enough

- * **Non-linear** objects... e.g. tree-level

- $T_{\mu\nu\alpha\beta}^{(2)} \sim H_{\mu\nu}^{\gamma} H_{\gamma\alpha\beta} (+ \partial_{[\mu} \partial^{[\alpha} \phi \partial_{\nu]} \partial^{\beta]} \phi) + \dots$

- * Can GCG explain T ... or $t_8 t_8 T^{(2)} R^3 + t_8 t_8 T^{(4)} R^2 + \dots$?

- * Dilaton!?!?!

Summary of type IIA $(\alpha')^3$ one-loop couplings (10D):

| | No B (linearised) | With B (non-linear) |
|------------|--|---|
| e-o | $\frac{1}{8}(t_8\epsilon_{10} + \epsilon_{10}t_8)BR^4$ | $B \wedge X_8(\Omega^{\text{LC}}) + \text{exact terms}$ |
| + | $= B \wedge X_8(\Omega^{\text{LC}})$ | |
| o-e | $= \frac{1}{192(2\pi)^4}B \wedge (\text{tr } R^4 - \frac{1}{4}(\text{tr } R^2)^2)$ | ? |
| e-e | $t_8t_8R^4$ | ? |
| o-o | $\frac{1}{8}\epsilon_{10}\epsilon_{10}R^4$ | ?? |

- ◊ $t_8 t_8 R^4 = t_{\mu_1 \dots \mu_8} t_{\nu_1 \dots \nu_8} R^{\mu_1 \mu_2}{}_{\nu_1 \nu_2} R^{\mu_3 \mu_4}{}_{\nu_3 \nu_4} R^{\mu_5 \mu_6}{}_{\nu_5 \nu_6} R^{\mu_7 \mu_8}{}_{\nu_7 \nu_8}$
 - ◊ $\epsilon_{10} \epsilon_{10} R^4 = \epsilon_{\alpha \beta \mu_1 \dots \mu_8} \epsilon^{\alpha \beta \nu_1 \dots \nu_8} R^{\mu_1 \mu_2}{}_{\nu_1 \nu_2} R^{\mu_3 \mu_4}{}_{\nu_3 \nu_4} R^{\mu_5 \mu_6}{}_{\nu_5 \nu_6} R^{\mu_7 \mu_8}{}_{\nu_7 \nu_8}$
 - ◊ At linearised level (4pt & some 5pt functions at one-loop) : $\Omega^{\text{LC}} \longrightarrow \Omega_{\pm}$
 - ◊ Curvature: $R(\Omega_{\pm})_{\mu\nu}{}^{\alpha\beta} = R_{\mu\nu}{}^{\alpha\beta} \pm \nabla_{[\mu} H_{\nu]}{}^{\alpha\beta} + \frac{1}{2} H_{[\mu}{}^{\alpha\gamma} H_{\nu]}{}_{\gamma}{}^{\beta}$
 - ◊ $\mathcal{N} = 1$ superinvariants: $J_0(\Omega) = (t_8 t_8 + \frac{1}{8} \epsilon_{10} \epsilon_{10}) R^4$
 $J_1(\Omega) = t_8 t_8 R^4 - \frac{1}{4} \epsilon_{10} t_8 B R^4$

$\mathcal{N} = 2$: M-theory/IIA on Calabi-Yau threefolds

- 4D quantum corrected effective action:

$$S = \frac{1}{2\kappa_4^2} \int d^4x \sqrt{g^\sigma} \left[\left((1 + \frac{\chi_T}{v_6}) e^{-2\phi_4} - \chi_1 \right) \mathcal{R}_{(4)} + \left((1 - \frac{\chi_T}{v_6}) e^{-2\phi_4} - \chi_1 \right) G_{vv} (\partial v)^2 \right. \\ \left. + \left((1 + \frac{\chi_T}{v_6}) e^{-2\phi_4} + \chi_1 \right) G_{hh} (\partial h)^2 \right]$$

- ▷ $v_6 = \mathcal{V}_3 (2\pi l_s)^{-6}$
- ▷ G_{vv} - the metric of the $h_{(1,1)} - 1$ vector-multiplets
- ▷ G_{hh} - the metric of the $h_{(1,2)}$ non-universal hypermultiplets
- ▷ $\chi_T = 2\zeta(3)\chi/(2\pi)^3$
- ▷ $\chi_1 = 4\zeta(2)\chi/(2\pi)^3$

- Weyl rescaling:

- ▷ Quantum corrections to vector and hyper moduli space metrics
- ▷ Corrections to the Kähler potential $(\mathcal{V}_3 \rightarrow \mathcal{V}_3 - \frac{\zeta(3)}{32\pi^3 g_s^{3/2}} \chi(X_3))$

Quantum corrections to $\mathcal{N} = 2$ moduli spaces:

- vector moduli (IIA): $G_{vv} \rightarrow (1 - \chi \frac{4}{(2\pi)^3} \frac{\zeta(3)}{v_6}) G_{vv}$ ($e^{-2\phi_4} = v_6 e^{-2\phi_{10}}$)
- (non-“universal”) hyper moduli (IIA): $G_{h\bar{h}} \rightarrow (1 + e^{2\phi_4} \frac{1}{6\pi} \chi) G_{h\bar{h}}$

2 “loop counting” parameters:

- for the corrections to the metric of vector multiplets(σ -model) :
 $e^{-2\tilde{\phi}_4} \simeq e^{-2\phi_4} \left(1 + \mu_T \frac{\chi_T}{v_6} + \dots\right)$ ($\chi_T = 2\zeta(3)\chi/(2\pi)^3$)
- for the corrections to the metric of hypermultiplets :
 $\tilde{v}_6 \simeq v_6 \left(1 - \frac{3\mu_1}{2}\chi_1 e^{2\phi_4} + \mathcal{O}(e^{4\phi_4})\right)$ ($\mu_1^2 = 4$ and $\chi_1 = 4\zeta(2)\chi/(2\pi)^3$)

classical “universal” hypermultiplet $(\phi_4, B_2, C_0 : C_3 \rightarrow C_0\Omega_3 + \bar{C}_0 \wedge \bar{\Omega}_3 + \dots)$

- classically - $SU(2, 1)/U(2)$ coset (3 isometries)
- Loop corrections - self dual Einstein metric defined by a single function:
 $e^{-2\tilde{\phi}_4} = 4\zeta(2)\chi/(2\pi)^3$

★ In fact, at the origin of the corrections ... 10d one-loop term $\alpha'^3 R^3 H^2$:

$$\int d^{10}x \sqrt{G} \delta_{s_1 \dots s_9}^{r_1 \dots r_9} R_{s_1 s_2}^{r_1 r_2} R_{s_3 s_4}^{r_3 r_4} R_{s_5 s_6}^{r_5 r_6} \left(H_{r_7 r_8 s_9} H_{s_7 s_8 r_9} - \frac{1}{9} H_{r_7 r_8 r_9} H_{s_7 s_8 s_9} \right)$$

$$\rightarrow \chi \int d^4x \sqrt{g^\sigma} H_{r_1 r_2 r_3} H^{r_1 r_2 r_3}$$

B-field couplings

★ Appearance of (at linearized level)

$$\hat{R}_{\mu\nu}^{\lambda\sigma}(\omega + \tfrac{1}{2}\mathcal{H}) = R_{\mu\nu}^{\lambda\sigma} + \tfrac{1}{2}\nabla_{[\mu}H_{\nu]}^{\lambda\sigma}$$

★ Inclusion of higher orders in B_2 required by

- supersymmetry
- T-duality (similarly for RR couplings to D-branes $C \wedge \sqrt{\hat{A}(X)} \text{ch}(x))$
- generalized geometry ??? hope for systematic geometric calculation?
- Heterotic/Type II duality ([refined](#)) map between tree-level and one-loop terms)

Summary of type II $(\alpha')^3$ one-loop couplings (10D):

| | No B (linearised) | With B (non-linear) |
|----------------------------|---|---|
| e-o + o-e | $\frac{1}{8}(t_8\epsilon_{10} + \epsilon_{10}t_8)BR^4$ $= B \wedge X_8(\Omega^{\text{LC}})$ $= \frac{1}{192(2\pi)^4} B \wedge (\text{tr } R^4 - \frac{1}{4}(\text{tr } R^2)^2)$ | $\frac{1}{8}(t_8\epsilon_{10} + \epsilon_{10}t_8)BR^4(\Omega_+)$ $= \frac{1}{8}t_8\epsilon_{10}B(R^4(\Omega_+) + R^4(\Omega_-))$ $= \frac{1}{2}B \wedge [X_8(\Omega_+) + X_8(\Omega_-)]$ $= \frac{1}{192 \cdot (2\pi)^4} B \wedge (\text{tr } R^4 - \frac{1}{4}(\text{tr } R^2)^2 + \text{exact terms})$ |
| e-e | $t_8t_8R^4$ | $t_8t_8R^4(\Omega_+) = t_8t_8R^4(\Omega_-)$ |
| o-o | $\frac{1}{8}\epsilon_{10}\epsilon_{10}R^4$ | $\frac{1}{8}\epsilon_{10}\epsilon_{10} (R(\Omega_+)^4 + \frac{8}{3}H^2 R(\Omega_+)^3 + \dots)$ $= \frac{1}{8}\epsilon_{10}\epsilon_{10} (R(\Omega_-)^4 + \frac{8}{3}H^2 R(\Omega_-)^3 + \dots)$ |

- ◊ new kinematic structures in o-o sector
- ◊ lifting to 11d: $H \mapsto G_4$ (ambiguities), then... reducing to get RR-field couplings
- ◊ dilaton!

Lift from D=10 to D=11

... is heavy and the ambiguities are not fully resolved.

Lift from D=6 to D=7 has the main features and can be done explicitly.

CP-odd part:

$$\frac{1}{4}B_2 \wedge \overline{X}_4 \quad \longrightarrow \quad -\frac{1}{32\pi^2} \quad C_3 \wedge \left(\text{tr } R^2 - \frac{1}{12}d(\mathcal{G}^{abc} \wedge (\nabla \mathcal{G})^{abc}) \right).$$

$$\diamond \quad \mathcal{G}_1^{abc} = 4G_{\mu\rho\lambda} d\hat{x}^\mu \hat{e}^{a\nu} \hat{e}^{b\rho} \hat{e}^{c\lambda}$$

CP-even part:

$$\begin{aligned} e^{-1}\delta\mathcal{L}^{\text{lift}} &= R_{\mu\nu\lambda\sigma}^2 - 2R_{\mu\nu}^2 + \frac{1}{2}R^2 - \frac{1}{6}R_{\mu\nu}G^{2\mu\nu} + \frac{1}{48}RG^2 + \frac{1}{6}\nabla_\mu G_{\nu\alpha\beta\gamma}\nabla^\nu G^{\mu\alpha\beta\gamma} \\ &\quad + \frac{1}{48}G_{\mu\nu\lambda\rho}G^{\mu\rho\alpha}{}_\beta G^{\nu\sigma\beta}{}_\gamma G^{\lambda\gamma}{}_{\alpha\sigma} + \frac{1}{288 \cdot 12}(G^2)^2 - \frac{1}{216}(G_{\mu\nu})^2 + (\text{eom})^2 \end{aligned}$$

Reducing back to 10D/6D

$$\diamond \quad \mathcal{G}_1^{abc} \quad \longrightarrow \quad (e^{\phi/2}\mathcal{F}^{abc}; \mathcal{H}^{ab})$$

allows to recover RR completion (1-loop only!)

Puzzles (at tree-level)

- One-loop results would suggest

$$J_0(\Omega) = (t_8 t_8 + \frac{1}{8} \epsilon_{10} \epsilon_{10}) R^4 \longrightarrow (t_8 t_8 + \frac{1}{8} \epsilon_{10} \epsilon_{10}) R^4(\Omega_+) + \frac{1}{3} \epsilon_{10} \epsilon_{10} H^2 R^3(\Omega_+) + \dots \\ = J_0(\Omega_+) + \Delta J_0(\Omega_+, H)$$

$$J_1(\Omega) = t_8 t_8 R^4 - \frac{1}{4} \epsilon_{10} t_8 B R^4 \longrightarrow t_8 t_8 R^4(\Omega_+) - \frac{1}{8} \epsilon_{10} t_8 B (R^4(\Omega_+) + R(\Omega_-)) = J_1(\Omega_+)$$

$\Delta J_0(\Omega_+, H)$ needs susy completion. $\mathcal{N} = 2$ tests:

- ⇒ problems at tree-level - 4D $\mathcal{N} = 2$
- ⇒ $c_2{}^I(t_I \text{tr } R^2 + u_I R \wedge R)$ with $c_2{}^I = \int_X \omega^I \wedge \text{tr } R^2$, $\omega^I \in H^{(1,1)}(X)$
 - ◊ $\mathcal{F}_1 W^2|_{\mathbb{F}\text{-term}}$ with W - $\mathcal{N} = 2$ chiral Weyl superfield and \mathcal{F}_1 - function of chiral vector superfields
- ⇒ important cancellations
 - ▷ Extra corrections (??): $J_0(\Omega) \longrightarrow J_0(\Omega_+) + \Delta J_0 + \cancel{\mathcal{S}}$ $J_1(\Omega) \longrightarrow J_1(\Omega_+) + \cancel{\mathcal{S}}$
 - ◊ not supported by string calculations
 - ▷ *Different* invariants at tree-level and 1-loop (!?): $J(\Omega) \longrightarrow J_0(\Omega_+) + \alpha_{(l)} \Delta^{(l)} J_0$
- ⇒ $\mathcal{N} = 4$ tests to follow

LBT - Lichnerowicz-Bismut theorem

- Lichnerowicz theorem:

$$(\nabla^a \nabla_a - \nabla^2) \epsilon = \frac{1}{4} R \quad \text{tensorial action!}$$

- ◊ ∇_a - Levi-Civita connection (no torsion)
- ◊ $\nabla = \gamma^a \nabla_a$ - Dirac operator

- Torsion H ($dH = 0$)

$$\begin{cases} D_a \epsilon = \nabla_a \epsilon - \alpha H_{abc} \gamma^{bc} \epsilon \\ D \epsilon = (\gamma^a \nabla_a - \beta H_{abc} \gamma^{abc}) \epsilon \end{cases} \leftarrow \text{torsionful Dirac operator}$$

- ◊ Note $D \neq \gamma^a D_a = \gamma^a \nabla_a - \alpha H_{abc} \gamma^{abc}$

- LBT: $(D^a D_a - D^2) \epsilon \quad \text{tensorial}$

$$(D^a D_a - D^2) \epsilon = \frac{1}{4} [R - \#H^2] \epsilon + \gamma^{abcd} \nabla_a H_{bcd} \epsilon + \\ (\alpha - 3\beta) \gamma^{ab} \nabla^c H_{abc} \epsilon + (\alpha - 3\beta) \gamma^{ab} H_{abc} (\nabla^c \epsilon)$$

- $\alpha = 3\beta$ ($\alpha = \frac{1}{8}$ for normalisation: $\frac{1}{12} H^2$)

gen. Lichnerowicz theorem (gLBT) \Rightarrow effective actions (Local data)

- (gen.) Lichnerowicz theorem: $(D^A D_A - D^2) \epsilon = [\frac{1}{4}S + \gamma^{abcd} I_{abcd}] \epsilon$ (S tensorial!)
- ◊ Heterotic effective action: $S = R + 4\nabla^2\phi - 4(\partial\phi)^2 - \frac{1}{12}H^2 - \frac{\alpha'}{4}\text{tr } \hat{\mathcal{F}}^2$
- ◊ $I_{abcd} = \frac{1}{6}\nabla_{[a}H_{bcd]} - \frac{\alpha'}{8}\text{tr } \hat{\mathcal{F}}_{[ab}\hat{\mathcal{F}}_{cd]} = 0$
- ◊
$$\left. \begin{array}{l} \delta\psi_a = D_a\epsilon = \nabla_a\epsilon - \frac{1}{8}H_{abc}\gamma^{bc}\epsilon \\ \delta\zeta_\alpha = D_\alpha\epsilon = -\frac{1}{8}\sqrt{2\alpha'}\hat{\mathcal{F}}_{ab\alpha}\gamma^{ab}\epsilon \end{array} \right\} \quad \leftarrow \quad \text{covariant derivative } (A = \{a, \alpha\})$$
- ◊ $\delta\lambda = D\epsilon = (\gamma^a\nabla_a - \frac{1}{24}H_{abc}\gamma^{abc} - \gamma^a\partial_a\phi)\epsilon \quad \leftarrow \quad \text{Dirac operator}$

Gravitational terms (obstruction to E) ?

- ◊ picking a substructure of the GFB ($O(d) \times G \times O(d)$ PB) splits $E = \tilde{C}_+ \oplus \tilde{C}_{\mathfrak{g}} \oplus \tilde{C}_-$
- ◊ take $G \rightarrow G_{\text{gauge}} \times O(d)$...
- ◊ reduce the structure group of E to $O(d) \times G \times O(d) \subset O(d + \dim(\mathfrak{g})) \times O(d)$
- ◊ Identify $O(d) \in G$ with $O(d)$ in \tilde{C}_+
 - ▷ Works only for $\hat{\mathcal{A}} = \Omega_+ = \omega^{\text{LC}} + \frac{1}{2}\mathcal{H}!!!$ (cf susy for $\Omega_-!!!$)
 - ▷ For type II $G \rightarrow O(d) \times O(d)$ does **NOT** work

▷ Flip of the sign in $\mathcal{O}(\alpha')$ effective action wrt D_a : $\Omega_- \rightarrow \Omega_+$!!!

$$\diamond \quad R_{mnpq}(\Omega^-) - R_{pqmn}(\Omega^+) = -12dH_{mnpq}$$

- leading to corrections all orders in α' :

▷ “gaugino” $\psi_{ab} \in \Gamma(\Lambda^2 C_+ \otimes S(C_-))$ for “gauge group” $O(d)_+$

$$\diamond \quad \delta\psi_{O(d)ab} = \frac{1}{8}\sqrt{\alpha'}R(\Omega^+)_{\bar{a}\bar{b}ab}\gamma^{\bar{a}\bar{b}}\epsilon \dots = D_{ab}\epsilon \quad (?)$$

▷ ψ_{ab} - composite “gravitino curvature”

$$\diamond \quad \delta\psi_{ab} = D_{ab}\epsilon + \frac{1}{8}\sqrt{\alpha'}\left(\frac{1}{8}\alpha'[\text{tr } F \wedge F - \text{tr } R(\Omega^+) \wedge R(\Omega^+)]_{ab\bar{a}\bar{b}}\right)\gamma^{\bar{a}\bar{b}}\epsilon \rightarrow \hat{D}_{ab}\epsilon$$

▷ $D_{ab} \rightarrow \hat{D}_{ab}$ in LBT $\Rightarrow \mathcal{O}(\alpha'^2)$ modifications of susy for

$$\gamma^{\bar{a}}\hat{D}_{\bar{a}}\gamma^{\bar{b}}\hat{D}_{\bar{b}}\epsilon - \hat{D}^a\hat{D}_a\epsilon + \hat{D}^\alpha\hat{D}_\alpha\epsilon + \hat{D}^{ab}\hat{D}_{ab}\epsilon = -\frac{1}{4}S^-\epsilon + \gamma^{abcd}I_{abcd}\epsilon$$

▷ hierarchy of higher α' corrections (consistent with GCG)

▷ $\mathcal{O}(\alpha'^3)$ agreement with literature

▷ new $\mathcal{O}(\alpha'^4)$ corrections

▷ iterative all order formulae ?

- ▷ “Tensoriality” without generalised geometry:

$$\not{D}\not{D}\epsilon - D_M D^M \epsilon - \frac{\alpha'}{64} \left(\text{tr } \not{F}\not{F}\epsilon - \text{tr } \not{R}^+ \not{R}^+ \epsilon \right) + 2\nabla^M \phi D_M \epsilon = -\frac{1}{4} \mathcal{L}_b \epsilon + \mathcal{O}(\alpha'^2)$$

(mod. heterotic BI: $dH = \frac{\alpha'}{4} (\text{tr } F \wedge F - \text{tr } R^+ \wedge R^+)$)

- ▷ \mathcal{L}_b - bosonic Lagrangian
- ▷ Multiply by $e^{-2\phi} \epsilon^\dagger$ and integrate by parts ($\epsilon^\dagger \epsilon = 1$):

$$\frac{1}{4} \mathcal{L}_b = (\not{D}\epsilon)^\dagger \not{D}\epsilon - (D_M \epsilon)^\dagger D^M \epsilon + \frac{\alpha'}{64} \left(\text{tr } \epsilon^\dagger \not{F}\not{F}\epsilon - \text{tr } \epsilon^\dagger \not{R}^+ \not{R}^+ \epsilon \right) + \mathcal{O}(\alpha'^2)$$

- ▷ The (bosonic) action

$$S_b = \int_{M_{10}} e^{-2\phi} \mathcal{L}_b = BPS^2$$

- ▷ Susy + BI \Rightarrow solutions alternative to Gen. Ricci computation:

$$\Gamma^M D_{[N}^- D_{M]}^- \epsilon - \frac{1}{2} D_N^- (\mathcal{O}\epsilon) + \frac{1}{2} \mathcal{O} D_N^- \epsilon = -\frac{1}{4} \mathcal{E}_{NM} \Gamma^M \epsilon + \frac{1}{8} \mathcal{B}_{NM} \Gamma^M \epsilon + \frac{1}{48} dH_{NMPQ} \Gamma^{MPQ} \epsilon$$

$\mathcal{O} = \not{\partial}\phi - \frac{1}{12} \not{H}$ and $\mathcal{E}_{NM}^0, \mathcal{B}_{NM}^0$ - EOMs for metric and B -field

M-theory & GCG

- Fields: $\{g_{mn}, \mathcal{A}_{mnp}, \psi_m\}$
 - ◊ $S_B = \frac{1}{2\kappa^2} \int \left(\sqrt{-g} R - \frac{1}{2} \mathcal{F} \wedge * \mathcal{F} - \frac{1}{6} \mathcal{A} \wedge \mathcal{F} \wedge \mathcal{F} \right)$
 - ◊ $S_F = \frac{1}{\kappa^2} \int \sqrt{-g} \left(\bar{\psi}_m \gamma^{mnp} \nabla_n \psi_p + \mathcal{F}_{p_1 \dots p_4} \left(\frac{1}{96} \bar{\psi}_m \gamma^{mp_1 \dots p_4 n} \psi_n + \frac{1}{8} \bar{\psi}^{p_1} \gamma^{p_2 p_3} \psi^{p_4} \right) \right)$
 - ▷ susy $\delta \psi_m = \nabla_m \varepsilon + \frac{1}{288} (\gamma_m{}^{n_1 \dots n_4} - 8 \delta_m{}^{n_1} \gamma^{n_2 n_3 n_4}) \mathcal{F}_{n_1 \dots n_4} \varepsilon = D_m \varepsilon$
 - ▷ eom $\gamma^{mnp} \nabla_n \psi_p + \frac{1}{96} (\gamma^{mnp_1 \dots p_4} \mathcal{F}_{p_1 \dots p_4} + 12 \mathcal{F}^{mn}{}_{p_1 p_2} \gamma^{p_1 p_2}) \psi_n = 0 = L^{mn} \psi_n$
- exact sequence: $S \xrightarrow{D} V \otimes S \xrightarrow{L} V \otimes S \xrightarrow{D^\dagger} S$
 - ▷ $L \circ D = 0$ follows from supersymmetry
 - ▷ reality of $\int \bar{\psi}_a L^{ab} \psi_b \Rightarrow L = -L^\dagger \Rightarrow D^\dagger \circ L = 0$.
- Lichnerowicz-type relation $\tilde{D}^a D_a \varepsilon = \gamma^{ab} D_a D_b \varepsilon \propto (\text{trace of Einstein} + 8\text{-form})$
 - ▷ $L^{ab} \psi_b = \gamma^{abc} D_b \psi_c$ and $\tilde{D}^c = \frac{1}{9} \gamma_a L^{ac} = \gamma^{bc} D_b$
 - ▷ coefs in D_a and \tilde{D}^a are *uniquely* fixed by tensoriality of rhs!
- LT $\Rightarrow S_B = \int \sqrt{-g} (\mathcal{R} - \frac{1}{3} \frac{1}{48} \mathcal{F}_{b_1 \dots b_4} \mathcal{F}^{b_1 \dots b_4}) - \frac{1}{3} \mathcal{A} \wedge (\mathrm{d} * \mathcal{F} + \frac{1}{2} \mathcal{F} \wedge \mathcal{F})$

Higher order (type IIA 1-loop) terms

$$D : S \rightarrow T^* \otimes S$$

$$(D\varepsilon)_a = \nabla_a \varepsilon + \alpha (\nabla^b X_{abcd}) \gamma^{cd} \varepsilon + \beta X_{abcd} \gamma^{cd} \nabla^b \varepsilon$$

$$\tilde{D} : T^* \otimes S \rightarrow S$$

$$(\tilde{D}\psi) = \gamma^{ab} \left(\nabla_a \psi_b + \tilde{\alpha} (\nabla^c X_{acef}) \gamma^{ef} \psi_b + \tilde{\beta} X_{acef} \gamma^{ef} \nabla^c \psi_b \right)$$

where $X_{abcd} \in [0, 2, 0, 0, 0]$ and α, β etc. parametrise higher-order corrections

$$\begin{aligned} (\tilde{D}D\varepsilon) &= \gamma^{ab} \nabla_a \nabla_b \varepsilon + (\alpha - \tilde{\alpha} - \beta) (\nabla^a X_{abcd}) \gamma^{cd} \nabla^b \varepsilon \\ &\quad - \alpha (\nabla^a \nabla^b X_{abcd}) \gamma^{cd} \varepsilon - (\tilde{\beta} + \beta) X_{abcd} \gamma^{cd} \nabla^a \nabla^b \varepsilon + \dots \\ (\text{if } \alpha - \tilde{\alpha} - \beta = 0) &= -\frac{1}{4} \mathcal{R} \varepsilon + \frac{1}{2} (2\alpha - \tilde{\beta} - \beta) R^{abe}{}_c X_{abed} \gamma^{cd} \varepsilon \\ &\quad + \frac{1}{4} (\tilde{\beta} + \beta) R^{abcd} X_{abcd} \varepsilon - \frac{1}{8} (\tilde{\beta} + \beta) R^{ab}{}_{cd} X_{abef} \gamma^{cdef} \varepsilon + \dots \end{aligned} \tag{1}$$

Ambiguities:

- ▷ $\alpha = \tilde{\alpha} = \beta = 0$ consistent: keeping susy classical and only correcting S_F
- ▷ $\tilde{\alpha} = 0, \alpha = \beta = \tilde{\beta}$: $\tilde{D}^a \nabla_a \varepsilon$ and $\gamma^{ab} \nabla_a D_b \varepsilon$ are separately tensorial (the fermionic action is in terms of "supercovariant" objects)

Everything that can modify susy:

| Projection of R^3 | Rep of $so(10, 1)$ | Multiplicity | multiplicity of embeddings in $\delta\psi$ | of which result in $[\nabla, \nabla]R^3$ | projected into form of rank |
|------------------------|-----------------------|--------------|---|---|--------------------------------|
| X^i | [0,2,0,0,0] | 8 | 1 | 1 | 2 |
| W^i | [2,0,0,0,0] | 3 | 3 | 1 | 2 |
| S^i | [0,0,0,0,0] | 2 | 1 | 1 | 2 |
| Y^i | [0,1,0,0,2] | 2 | 1 | 1 | 6 |
| V^i | [1,0,0,0,2] | 2 | 4 | 2 | 4, 6 |
| T^i | [0,0,0,1,0] | 3 | 5 | 3 | 2, 4, 6 |
| Z^i | [0,1,0,1,0] | 3 | 1 | 1 | 4 |
| U^i | [1,0,1,0,0] | 3 | 4 | 2 | 2, 4 |
| L^i | [2,1,0,0,0] | 3 | 1 | 0 | - |
| M^i | [2,0,0,1,0] | 6 | 1 | 0 | - |

The last two lead to symmetrised ∇ and so are immediately ruled out. The other terms all admit at least one combination which corresponds to $R^3[\nabla, \nabla]\varepsilon$ in the Lichnerowicz, which thus give rise to R^4 terms.

These R^4 will appear as p -forms contracted with gamma-matrices acting on the spinor.
The different terms contribute to different forms as follows:

| p -form : | 0 | 1 | 2 | 3 | 4 | 5 |
|---------------------|---|---|---|---|----|---|
| R^4 multiplicity: | 7 | 0 | 1 | 2 | 17 | 0 |
| $X^i \otimes R$ | • | - | • | - | • | - |
| $W^i \otimes R$ | - | - | - | - | - | - |
| $S^i \otimes R$ | - | - | - | - | - | - |
| $Y^i \otimes R$ | - | - | - | • | • | - |
| $V^i \otimes R$ | - | - | - | - | • | - |
| $T^i \otimes R$ | - | - | - | - | • | - |
| $Z^i \otimes R$ | - | - | • | - | • | - |
| $U^i \otimes R$ | - | - | • | - | • | - |

!!! Nothing is possible at R^2 and R^3 order !!!

- ▷ Tensoriality of $\tilde{D}D$ + cancellation of 2,4,6-forms yields 2 independent invariants
 - ◊ $x \left((t_8 t_8 - \frac{1}{8} \epsilon \epsilon) R^4 + \frac{1}{2} \epsilon t_8 C R^4 \right)$
 - ◊ $y (t_8 t_8 + \frac{1}{8} \epsilon \epsilon) R^4$
- ▷ what fixes $y = 0$?
 - ◊ fermion terms and “actual” supersymmetry
 - ◊ inclusion of \mathcal{F}
 - ◊ next order $\sim R^7$ (lift from 2-loop string terms)

Geometry of string theory (GCG?) \iff non-linear completions of gravity

As things stand:

| | 4pt | | 5pt | | 6pt | | ... |
|---------|------|--------|------|--------|------|--------|-----|
| | tree | 1-loop | tree | 1-loop | tree | 1-loop | - |
| strings | ✓ | ✓ | ⊕ | ✓ | ⊕ | (~) ✓ | - |
| GCG | ~ | (~) ✓ | ?! | ? | ?! | ? | ??? |

- ◊ (~) ✓ - work with André Coimbra
- ◊ ✓, (~) ✓, ⊕ - work with Jim Liu
- ◊ ?, ?! - need to be explained
- ◊ ??? - GCG making predictions

$\mathcal{N} = 4$ tests : 6D (1, 1) and (2, 0) theories

Supersymmetry (classification of supervertices):

- (1, 1) theory (IIA/K3):
 - ◊ tree-level: \emptyset
 - ◊ 1-loop: $B_2 \wedge \overline{X}_4 + \dots$ ✓
- (2, 0) theory (IIB/K3)
 - ◊ tree-level: \emptyset
 - ◊ 1-loop \emptyset (gravity multiplet)
 - ◊ 4-derivative interaction quartic in tensor multiplets

Cancellations:

- On $K3$: $J_0 \rightarrow (t_4 t_4 + \frac{1}{8} \epsilon_6 \epsilon_6) R^2 \rightarrow$ Ricci $\rightarrow 0 \dots$ Linear
- **Complete** cancellations are very non-trivial
 - ◊ verify ΔJ for one-loop $J_0(\Omega_+) + \Delta J_0(\Omega_+, H)$ (+more!)
 - ◊ three-level 5pt-functions

6D (2, 0) theory at one loop (testing $\Delta^{(1)} J_0$)

Linearised CP-odd: $\mathcal{I} \rightarrow H \wedge \text{tr}(\mathcal{H} \wedge R) \rightarrow R_{\mu\nu}(\epsilon \cdot H \cdot H)_{\mu\nu} \rightarrow 0$

The non-linear result (Note $SO(5)$ R-symmetry: $5 \rightarrow \mathbf{1} + \mathbf{\bar{A}}$)

- $\mathcal{L}_{\text{CP-even}} = (t_4 t_4 - \epsilon_4 \epsilon_4) R(\Omega_+)^2 - \Delta J$
- For gravity multiplet only - H is **self-dual**:

$$\mathcal{L}_{\text{CP-even}} + 4\mathcal{I} = 4(R_{\mu\nu} - \frac{1}{4}H_{\mu\nu}^2)^2 - (R + \frac{1}{12}H^2)^2$$

- gravity + 1 TM (for the scalars again $5 \rightarrow \mathbf{1} + \mathbf{\bar{A}}$)

$$\mathcal{L}_{\text{CP-even}} + 4\mathcal{I} = \frac{4}{3}H^{(-)4} + H_{\mu\nu}^{(-)2}\partial^\mu\phi\partial^\nu\phi + 16(\partial\phi^2)^2$$

only 4pt+ couplings in TM (✓)

- ◊ One-loop under control!
- ◊ New superinvariants $J_1^+(\Omega_+) = t_8 t_8 R^4 - \frac{1}{8}\epsilon_{10} t_8 B R^4(\Omega_+)$ & $J_1^-(\Omega_-) = \frac{1}{8}\epsilon_{10} \epsilon_{10} R^4 + \Delta J_0 + \frac{1}{8}\epsilon_{10} t_8 B R^4(-)$
- ◊ $J_1^{\text{IIA/IB}} = J_1^+(\Omega_+) \mp J_1^-(\Omega_-)$

Nonlinear tree-level cancellations....

...are much harder!

$R(\Omega^{\text{LC}}) \longrightarrow R(\Omega_{\pm})$ needed but not enough

- New couplings $t_8 t_8 T^{(2)} R^3$
- with **non-linear** objects... $T_{\mu\nu\alpha\beta}^{(2)} \sim H_{\mu\nu}{}^\gamma H_{\gamma\alpha\beta} (+\partial_{[\mu}\partial^{[\alpha}\phi\partial_{\nu]}\partial^{\beta]}\phi) + \dots$
- * ... tree-level 5pt calculations ...
- $T^{(4)}$ (and $t_8 t_8 T^{(4)} R^2$)
- * ... keep dreaming ...

Any geometry in all this????
